

Lab: Objects and Classes

Problems for exercise and homework for the ["JS Fundamentals" Course @ SoftUni](https://softuni.org/).
Submit your solutions in the SoftUni judge system at: <https://judge.softuni.bg/Contests/1323>

1. Person Info

Write a function that receives **3 parameters**, sets them to an **object** and **returns** that object.

The input comes as **3 separate strings** in the following order: **firstName**, **lastName**, **age**.

Examples

Input	Object Properties
"Peter", "Pan", "20"	firstName: Peter lastName: Pan age: 20

Hints

```
function personInfo(firstName, lastName, age) {  
    // TODO: Create the person object and set the properties  
  
    return person;  
};
```

2. City

Receive a **single parameter** – an **object**, containing **five properties**:

{ name, area, population, country, postcode }

Loop through all the **keys** and **print** them with their **values** in format: **"{key} -> {value}"**

See the examples below.

Examples

Input	Output
{ name: "Sofia", area: 492, population: 1238438, country: "Bulgaria", }	name -> Sofia area -> 492 population -> 1238438 country -> Bulgaria postCode -> 1000

<pre>postCode: "1000" }</pre>	
-------------------------------	--

3. Convert to Object

Write a function that receives a **string** in **JSON format** and converts it to **object**.

Loop through all the keys and print them with their values in format: "{key}: {value}"

Examples

Input	Output
'{"name": "George", "age": 40, "town": "Sofia"}'	name: George age: 40 town: Sofia

Hints

- Use **JSON.parse()** method to parse JSON string to an object

```
function solve(jsonStr) {
    let person = JSON.parse(jsonStr);

    //TODO: Iterate through the properties and
    //TODO: print the result
}

solve('{"name": "George", "age": 40, "town": "Sofia"}');
```

4. Convert to JSON

Write a Function That Receives Name, LastName, HairColor and Sets Them to an Object.

Convert the **object** to **JSON string** and print it.

Input is provided as **3 single strings** in the order stated above.

Examples

Input	Output
'George', 'Jones', 'Brown'	{"name": "George", "lastName": "Jones", "hairColor": "Brown"}

Hints

- Use **JSON.stringify()** to parse the object to JSON string

```
function solve(name, lastName, hairColor) {
    //TODO: Create an object with the given input
    console.log(JSON.stringify(person));
}

solve('George', 'Jones', 'Brown');
```

5. Cats

Write a function that receives **array** of strings in the following format '{cat name} {age}'.

Create a **Cat class** that receives in the **constructor** the **name** and the **age** parsed from the input.

It should also have a function named **"meow"** that will print "{cat name}, age {age} says Meow" on the console.

For each of the strings provided you must **create a cat object**.

Examples

Input	Output
['Mellow 2', 'Tom 5']	Mellow, age 2 says Meow Tom, age 5 says Meow

Hints

- Create a Cat class with properties and methods described above
- Parse the input data
- Create all objects using class constructor and the parsed input data, store them in an array
- Loop through the array using **for...of** cycle and **invoke .meow()** method

```
function solve(arr) {
    let cats = [];
    //TODO: Create class Cat

    for (let i = 0; i < arr.length; i++) {
        let catData = arr[i].split(' ');
        let name, age;
        [name, age] = [catData[0], catData[1]];
        cats.push(new Cat(name, age));
    }
    //TODO: Iterate through cats[] and invoke .meow() using for...of loop
}

solve(['Mellow 2', 'Tom 5']);
```

6. Songs

Define a **class Song**, which holds the following information about songs: **typeList**, **name** and **time**.

You will receive the input as an **array**.

The first element **n** will be the number of songs. Next **n** elements will be the songs data in the following format: "{typeList}_{name}_{time}", and the the last element will be **Type List** / "all".

Print only the **names of the songs** which are from that **Type List** / **All songs**.

Examples

Input	Output
[3, 'favourite_DownTown_3:14', 'favourite_Kiss_4:16', 'favourite_Smooth Criminal_4:01', 'favourite']	DownTown Kiss Smooth Criminal
[4, 'favourite_DownTown_3:14', 'listenLater_Andalouse_3:24', 'favourite_In To The Night_3:58', 'favourite_Live It Up_3:48', 'listenLater']	Andalouse
[2, 'like_Replay_3:15', 'ban_Photoshop_3:48', 'all']	Replay Photoshop

Solution:

Create a Song class with properties described above

```
class Song {  
    constructor(type, name, time) {  
        this.type = type;  
        this.name = name;  
        this.time = time;  
    }  
}
```

Create a new array, where you will store songs

```
let songs = [];  
let numberOfSongs = input.shift();  
let typeSong = input.pop();
```

Iterate over the songs:

```
for (let i = 0; i < numberOfSongs; i++) {  
  let [type, name, time] = input[i].split('_');  
  let song = new Song(type, name, time);  
  songs.push(song);  
}
```

```
if (typeSong === 'all') {  
  songs.forEach((i) => console.log(i.name));  
} else {  
  let filtered = songs.filter((i) => i.type === typeSong);  
  filtered.forEach((i) => console.log(i.name));  
}
```
